

# A forest of lines:

## A 159–211 GHz spectral line survey of SGR B<sub>2</sub>(N) with the SEPIA receiver at APEX

Katharina Immer  
Joint Institute for VLBI ERIC  
Collaborators: Á. Sánchez-Monge, T. Möller, P. Schilke

# The Swedish-ESO PI receiver (SEPIA)

@APEX since 2015  
Band 5, Band 7 (~2019), Band 9

Band 5:  
159 – 211 GHz

# Atmospheric Transmission

# The Swedish-ESO PI receiver (SEPIA)

@APEX since 2015

Band 5, Band 7 (~2019), Band 9

Band 5:

159 – 211 GHz

Dual polarization 2-sideband (SB)  
receiver, 4 GHz per SB, 12 GHz  
separation

Full velocity resolution: 0.05-0.07 km/s

# The Swedish-ESO PI receiver (SEPIA)

@APEX since 2015

Band 5, Band 7 (~2019), Band 9

Band 5:

159 – 211 GHz

Dual polarization 2-sideband (SB)  
receiver, 4 GHz per SB, 12 GHz  
separation

Full velocity resolution: 0.05-0.07 km/s

Now also available at ALMA!

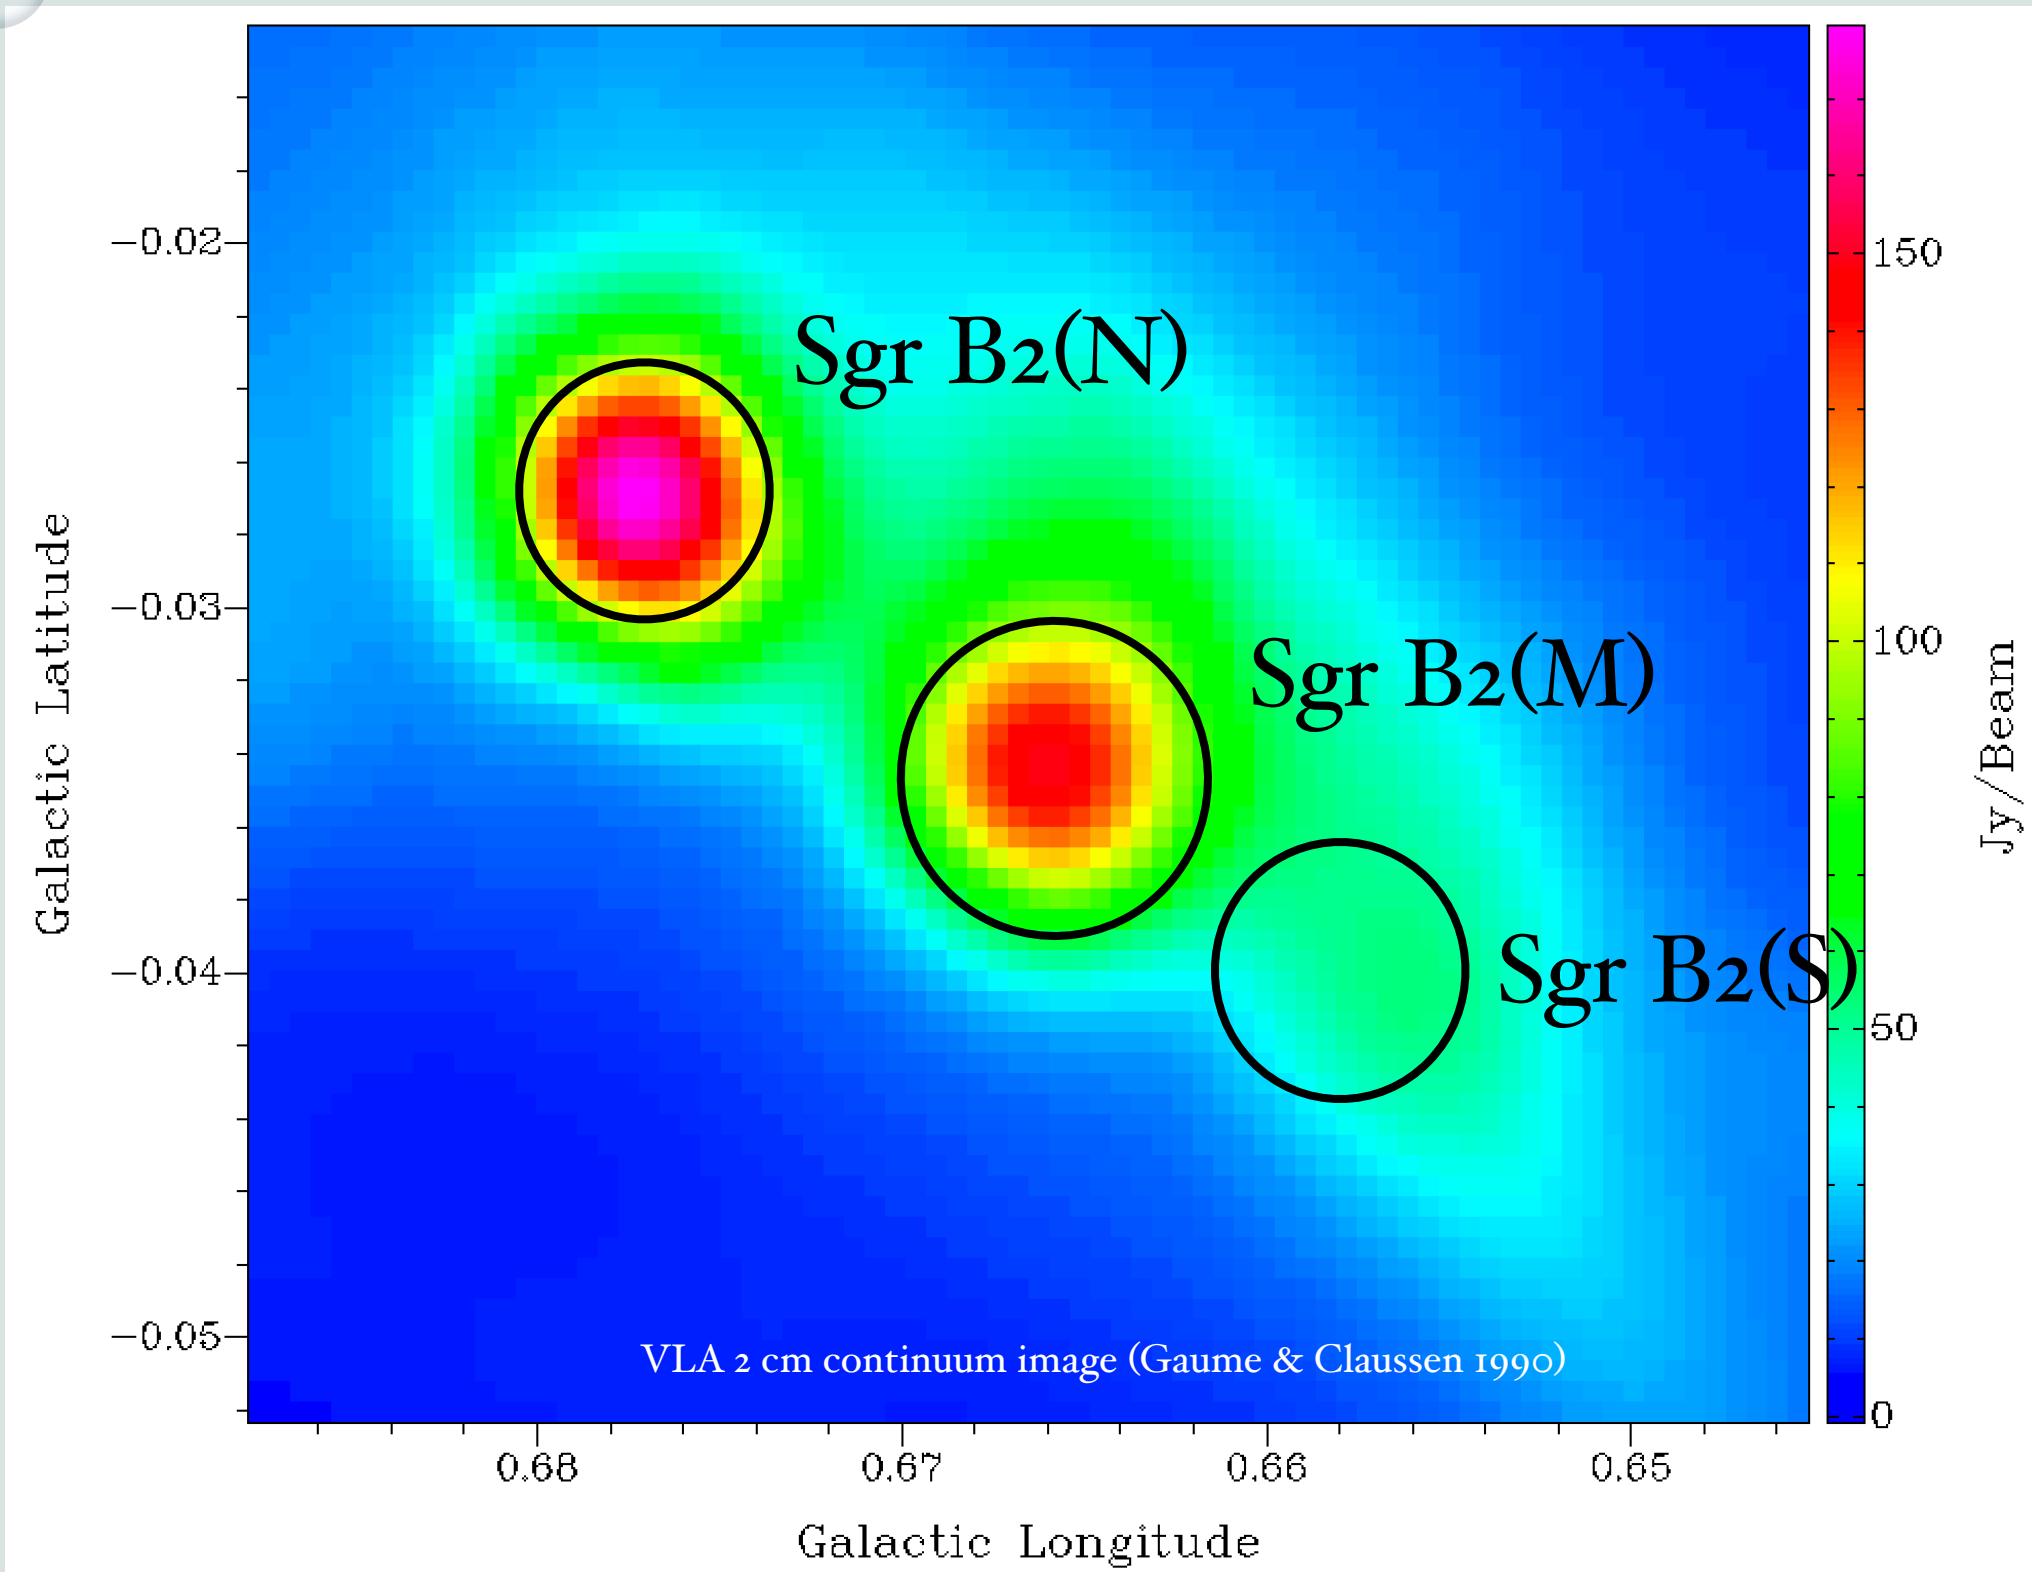

# Sgr B2

# Sgr B2(N)

870  $\mu\text{m}$  emission, ATLASGAL survey (Schuller et al. 2009)

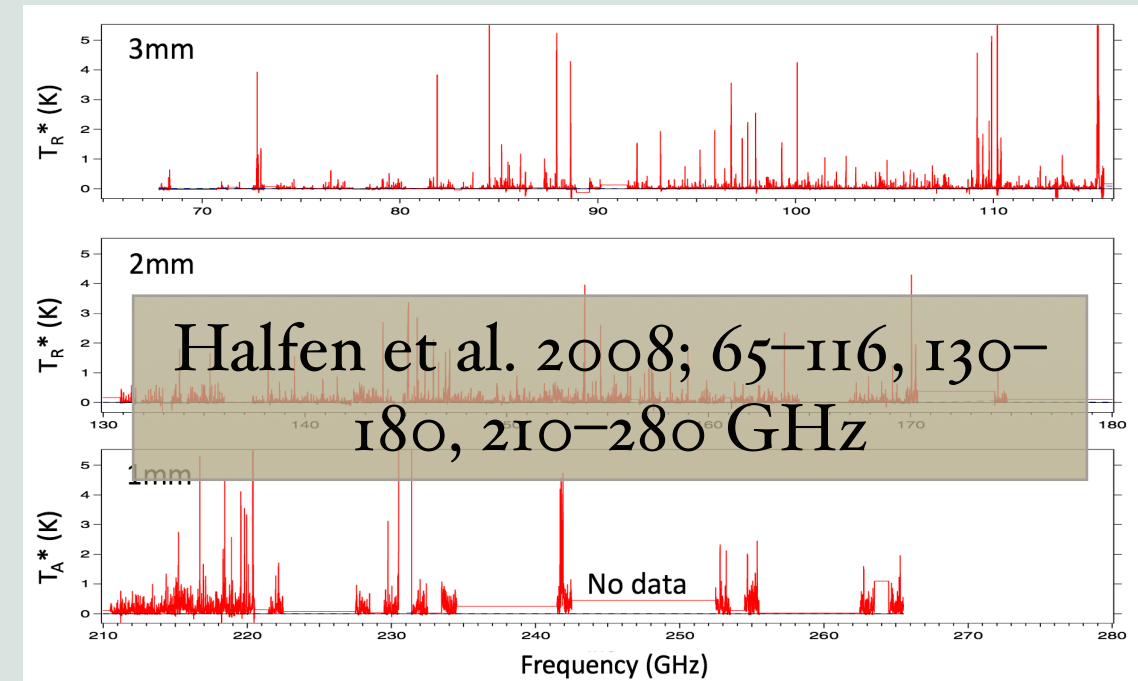

# Spectral line surveys of Sgr B2(N) (extract)

Large frequency range covered!

=> many transitions of many different molecules observed

=> reliably identify the presence of a molecule

=> contribution of all detected molecules can be modeled at once, smaller number of misidentified molecules

# Science Verification Observations

Science verification project for SEPIA Band 5

On/Off observations of Sgr B2(N) in July/September 2015

Spectral coverage: 159.2 – 210.7 GHz; 8 different tunings

Total on-source time of 172 min

Smoothed velocity resolution: 0.5–0.7 km/s

# Observed Spectrum

Many spectral lines, almost no line-free channels  
Automatic search for line-free channels in an iterative way

$T_B$  (K)

Rest Frequency (MHz)

# Final Spectrum

# Belloche et al. (2013)

IRAM 30m observations of Sgr B2(N)

Covered frequency range (GHz): 80-116, 136-148, 154-155, 163-173, 176-177, 202-267

3675 spectral lines detected at 3 mm, 70% identified and assigned to 56 molecules, 66 isotopologues, 59 vibrationally excited states of these molecules

Radiative transfer fitting

# XCLASS modeling

Radiative transfer modeling with XCLASS software (Moeller et al. 2017)

Use Belloche et al. 2013 parameters for synthetic spectrum with XCLASS: 122 species fitted (molecules, isotopologues, vibrational states); 59 species not included in VAMDC (mostly vibrational states)

Fixed parameters: Size of the emission, Central Velocity, Line Width, Tag for Absorption/Emission

Fitted parameters: Temperature, Column Density

# Final modeled spectrum

Immer et al., in prep

# Column density vs temperature

# Distribution of parameters

Line Width Distribution

Central Velocity Distribution

Size Distribution

Temperature Distribution

Column Density Distribution

# Column density vs temperature

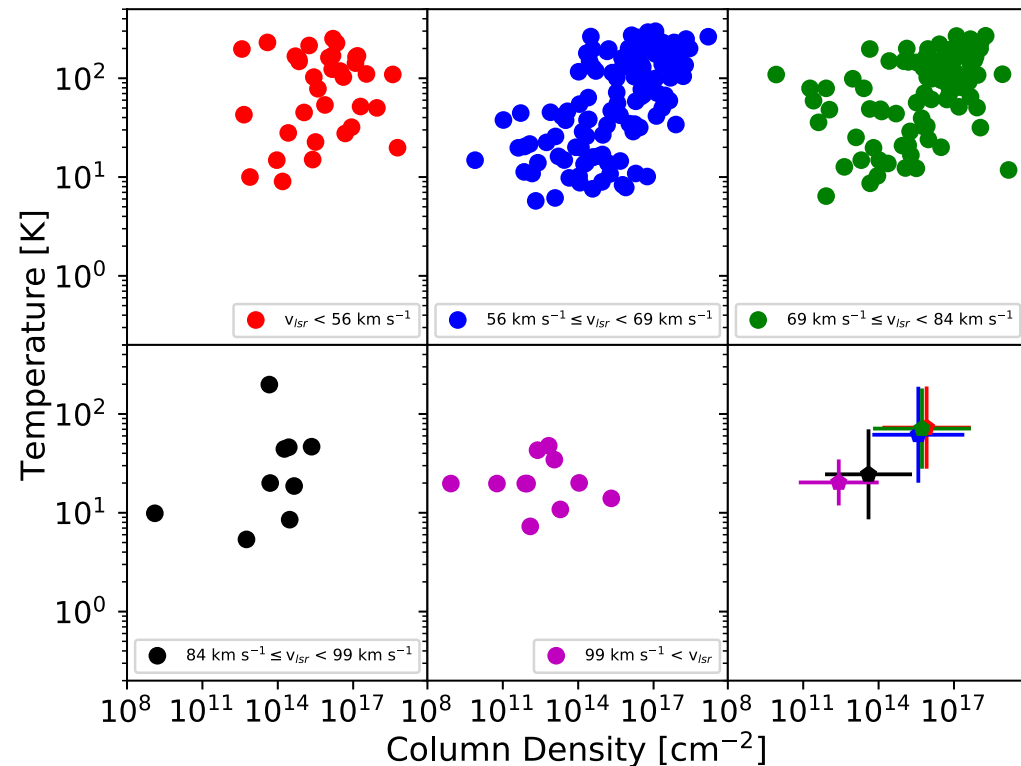

## Size of the emission

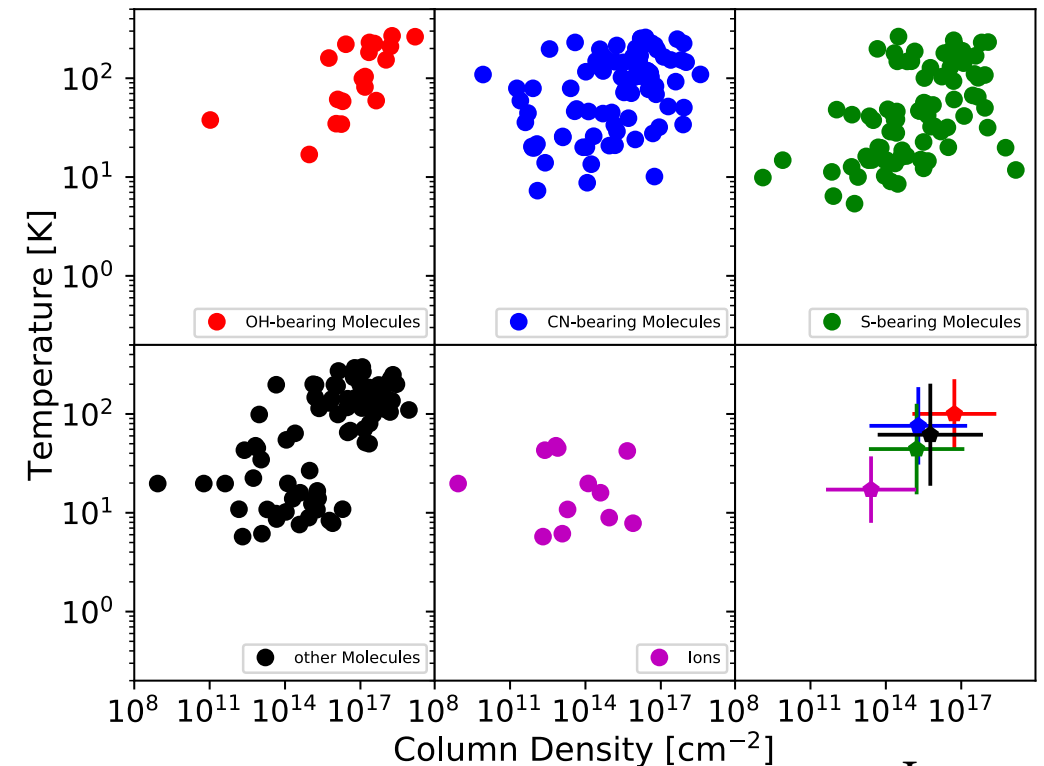

## Line width

## Central velocity

## Molecule type

# Isotopologue ratios

Isotopes fitted independently in XCLASS -> isotopologue ratios

# Conclusion

# SEPIA spectral line survey of Sgr B2(N)

# Radiative transfer modeling with XCLASS

More compact emission is denser and hotter

## Isotopologue ratios
